

Overall this project was easy going. I ran into something I never encountered before and the output did not make sense to me so I did a little research and came to this:

Learned what the EXPLAIN Output meant

- Id:
 - ◆ Query step identifier (1 = first/only step).
- Select_type:
 - ◆ SIMPLE means it's a basic SELECT query (no subqueries or unions).
- Table:
 - ◆ The table being accessed (passengers_on_flights).
- Partitions:
 - ◆ NULL here means no partitioning is used.
- Possible_keys:
 - ◆ Shows available indexes (idx_route_id) that can be used.
- Key:
 - ◆ The actual index MySQL decided to use (idx_route_id is used—this is good!).
- Key_len:
 - ◆ The length of the key (3 means integer key size is being used efficiently).
- Ref:
 - ◆ Type of reference comparison (const indicates a constant value is used in the WHERE clause).
- Rows:
 - ◆ MySQL's estimate of how many rows it will scan (here it's 5 rows).
- Filtered:
 - ◆ Percentage of rows filtered (100% means all scanned rows meet your filter).
- Extra:
 - ◆ NULL means no extra steps (like temp tables or filesort) are needed.
